                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This octamer was found to be immunoreactive with anti-HCV anti-sera. In the epitope mapping experiment three different samples of anti-sera were reacted with the peptide octamer, and then incubated with HRP-labelled goat anti-human 1g antisera, to enable detection of binding. This epitope starts from amino acid 465 of the HCV polyprotein. This was found to be a particulary strong epitope. (Updated on 25-MAR-2003 to correct PN field.)
                 This is one of 57 specific examples of highly generic reduced size LHRH analogues. It is based on amino acid residues 2 to 9 of natural LHRH. The analogues can be used for treating diseases resulting from gonadal hormone over or under-production in either sex, controlling reproduction, as fertility promoters when administered in pulses or for reducing dihydrotestosterone levels. See also AAR11089 and AAR11091-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hepatitis C virus sequences - for of hepatitis C infection.

This is a MDWZ binding peptide derivative capable of binding to a human oncogenic protein MDMZ. The MDMZ binding peptides can specifically invitro concogenic protein MDMZ. The MDMZ binding of the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDMZ can induce growth arrest or apoptosis in tumbour cells comprising a wild-type p53 and non-elevated levels of MDMZ. The peptides may be used to identify molecules that bind to MDMZ and to identify and design inhibitors of MDMZ. They may also be used to purify binding partners especially MDMZ, diagnose disease by meásuring levels of MDMZ in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDMZ interactions, especially tumours and viral infections. The peptides can be administered masslly, rectally, orally or by interfering with MDMZ/p53 interaction, the peptides can cativate and accumulation in normal cells. The peptides can activate moleculation in normal cells. The peptides can activate pompared with wild-type p53 blocking activity compared with wild-type p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Compounds binding to MDM2 protein and inhibit its interaction with p53 - useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Boettger A, Picksley S, Hochkeppel H;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A heat shock protein (HSP) binding domain (AAW19954) can be used as a component of a hybrid target antigen that also comprises an immunogenic domain. The hybrid antigen is combined in vitro with a HSP to form a complex that, when administered to a subject, induces an immune response. Target antigen-HSP complexes can be used to treat infectious diseases, or to treat cancers by eliciting an immune response to a tumour antigen. Alternatively, a nucleic acid encoding the HSP and the target antigen is administered such that the HSP and target antigen bind in situ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compsn. for inducing immune response contg. antigen and heat shock protein - also new hybrid peptide and related nucleic acid, for treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-APR-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-JAN-1998.
     This is a MDM2 binding peptide derivative capable of binding to a human oncogenic protein MDM2. The MDM2 binding peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides can which mimic the MDM2 binding site in p53, have a significantly greater blocking activity compared with wild-type p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.

This represents a generic peptide that is capable of binding to an oncogenic protein MPMZ (especially human DMZ). The peptide and its derivatives can specifically inhibit or block the binding of MPMZ to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDMZ can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDMZ. The peptide or its derivatives may be used to identify molecules that bind to MDMZ and to identify and design inhibitors of MDMZ/p53 binding. They may also be used to purify binding partners especially MDMZ, diagnose disease by measuring levels of MDMZ in blood of cancer and leuksemia patients and to treatment or prevention of disease involving p53/MDMZ interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDMZ/p53 interaction, the peptides can activate p53 inction and accumulation in normal cells. The peptides which minit the MDMZ binding site in p53, have a significantly greater blocking activity compared with wild-type p53
                                                                                                 Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                                                                                    Claim 7; Page 42; 45pp; English.

This is a MDM2 binding peptide derivative capable of binding to a human concogenic protein MDM2. The MDM2 binding peptides can specifically concogenic protein MDM2. The MDM2 binding peptides can specifically concogenic or in vivo. Inhibiting the interaction between the p53 protein, in virco or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners of especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leuksemia partients and for treatment or prevention of disease involving p53/MDM2 interactions, especially, rectally, orally or by the peptides can be administered nasally, rectally, orally or by inferienting with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides can activate p53 function and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater blooking activity compared with wild-type p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compounds binding to MDM2 protein and inhibit its interaction with p53 - useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                          MDM2; oncogenic protein; p53; human; inhibition; interaction; cancer; tumour; diagnosis; binding; viral infection.

This is a MDM2 binding peptide derivative capable of binding to a human oncogenic protein MDM2. The MDM2 binding peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered masally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can accinvate p53 function and accumulation in normal cells. The peptides manic the MDM2 binding site in p53, have a significantly greater b51 blocking activity compared with wild-type p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                                                                                                      /label= OTHER

The MDM2 binding peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     notes "Ac3c (1-amino-cyclopropane-1-carboxylic acid)"

This peptide is capable of binding to an oncogenic protein MDM2 (especially human DM2). The MDM2 binding peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type of p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of mDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by messuring levels of MDM2 in blood of cancer and leuksemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by cirigerion. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater
                                                                                                                                                                                                                          ô
               infections
cancer and leukaemia patients and for treatment or prevention of disease
           involving p53/MDM2 inferactions, especially tumours and viral infection. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 inntena and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater blocking activity compared with wild-type p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MDM2; oncogenic protein; p53; human; inhibition; interaction; cancer; tumour; diagnosis; binding; viral infection.

The MDM2 binding peptides can specifically inhibit to block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compounds binding to MDM2 protein and inhibit its interaction with p53 useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents.
                                                                                                                                                                                                                                                 MDM2; oncogenic protein; p53; human; inhibition; interaction; cancer; tumour; diagnosis; binding; viral infection.

lymphocytes (CD8+ epitopes), T helper cells (CD4+ epitopes), or B epitopes recognized by corresponding antibodies. The epitopes may be used in the composition of the invention. The specification describes a lipopeptide that has a peptide part derived from mammalian interferon gamma (IFNg) and one or more lipophilic parts comprising a linear or branched, (un) saturated 4-20C hydrocarbyl chain or a steroid. The lipopeptide are used to treat or prevent any condition that responds to lipopeptide and used to treat or prevent any condition that responds to lipopeptide as adjuvant for vaccines (particularly those directed against tumors, viral or parasitic infections), to stimulate or (re)orient the immune response between types 1 and 2 cytokine profiles. Particular applications are treatment of infections (particularly viral, e.g. cquired immune deficiency syndrome, papilloma (cancer) and hepatitis, but also bacterial, fungal, parasitic or helminth); cancers (particularly resorthelioma), allergy; and autoimmune diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New lipopeptide comprising C-terminal interferon-gamma fragment with attached lipophilic groups, used as interferon mimic, e.g. for treating cancer or virus infection.
injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater blocking activity compared with wild-type p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ξ.

They can also be used to produce immunological vaccines which may be used to prevent and/or treat conditions involving hypersensitivity to allergens. This sequence represents a hypothetical peptide which can be used to desensities the human anjor histocombatibility complex (MHC) class II response to

                                                                                                                                                                                                                                                                                                                              The invention relates to the generation of a lipopeptide comprising at least one auxiliary T epitope, at least one cytotoxic T lymphocyte (CTL) epitope and at least one lipid residue with (1) the epitopes and lipid portion and (11) the epitopes, being separated independently by peptide spacers. These spacers comprise sequences of amino acids which carry an overall electrical charge in neutral media to ensure that the lipopeptide is hydrophilic. The peptides AXYS3301-YS5S49 represents examples of peptide epitopes used to generate the lipopeptides. These are used in therapeutic or prophylactic compositions and vaccines to induce specific immune responses against human immunodeficiency, hepatitis B or papilloma viruses; p53 of melanoma or the malaria parasite
                                                                                                                                           New lipopeptide containing lipid regions and two epitopes, all separated by peptide spacers that impart hydrophilicity, useful in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the generation of mixed micelles or microaggregates for inducing an immune response comprise: (a) a first lipopeptide comprising at least one CTL (Cytocoxic T-lymphocyte) epitope and at least one lipid unit; and (b) a second lipopeptide comprising at different from that of the first lipopeptide. This peptide represents an example of a lipopeptide epitope used in the invention and is derived from a human immunodeficiency virus type 1 (HIV-1) protein. The firmunogenic lipopeptide micelles are used in vaccines, especially against HIV, hepatitis B virus (HBV), papilloma viruses, p53, melanoma or

The invention relates to conjugate peptides engineered to noncovalently bind to heat shock proteins (hsp). A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hsp target, and bound to a benzoquinone ansamycin antibiotic (BAA), in a physiologic binding buffer; (b) isolating a phage binding to the hsp target, and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethéring peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. diseases caused by a bacterium, virus, proteozoan, mycoplasma, fungus, yeast, parasite or prion, or a disease of the immune system, e.g. acquired immune deficiencies or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3B virus; HGBV; diagnosis; therapeutic; immunogenic; infection; characterisation; hepatitis.

The present invention describes isolated prepared HER2/neu epitopes (I). Also described are: (1) a clonal cytotoxic T lymphocyte (CTL) that is culture in vitro and binds to a complex of an epitope (II, bound to a chuman leukocyte antigen (HLA) molecule; (2) a peptide (II) comprising (I) and a second epitope and the peptide is less than 50 contiguous amino caids that have 100% identity with a native peptide sequence of HERZ/neu; (3) a vaccine composition (III) comprising (II) and a pharmaccutical excipient; (4) an isolated nucleic acid encoding a peptide comprising (I) cand (5) an isolated nucleic acid encoding (II). (I) has cytostatic and immunostimular activities, and can be used in vaccines (I). (II) and (III) are useful for inducing cellular immune responses for the prevention and treatment of cancer. (I) and (II) are useful for inducing cellular immune response for the contigen when incubated with a T lymphocyte sample form a patient and detecting the presence of bound T lymphocyte sample form a patient and detecting the presence of bound T lymphocyte sample form a patient and cation shown and immunosuppressive epitopes may be combined to in whole antigens may be avoided. Selected epitopes may be combined to enhance immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigen is eliminated. The vaccine sprovides the apportunity to combine epitopes derived from the same pathogen. Epitope-based anti-tumour selected antigen loss. AAG88266 to AAG89121 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, HER2/neu, epitope, human leukocyte antigen, HLA; T cell,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describe a method for detecting target hepatitis GB virus (HGBV) nucleic acid (THN) in a test sample (T) suspected of containing HGBV. The method involves reacting (T) with a HGBV polymuclectide probe (I) containing 15 contiguous nucleotides, and which selectively hybridises to the HGBV genome or its full complement, and detecting the complex that contains THN, indicating the presence of target HGBV. The method is used for detecting target HGBV nucleic acid in the test sample suspected of containing HGBV and for characterisation of newly ascertained etiological agent of non-A, non-B, non-C, non-D and non-B, and and AAA55270 to AAA55489 and AAB08985 to AAB09480 represent nucleotide and protein sequences used in the exemplification of the present invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                         Detecting target hepatitis GB virus nucleic acid in a test sample suspected of containing HGBV comprises reacting the test sample the HGBV polynucleotide probe and detecting the complex that contains target HGBV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; HER2/neu; epitope; human leukocyte antigen; HLA; T cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                        The present invention describes isolated prepared HREA/new epitopes (I).

Also described are: (I) a clonal cyttocxic T lymphocyte (CTL) that is culture in vitro and binds to a complex of an epitope (I), bound to a culture in vitro and binds to a complex of an epitope (I), bound to a culture in vitro and binds to a complex (I) comprising (I) cand second epitope and the peptide is less than 50 contiguous amino acids that have 100% identity with a native peptide sequence of HERZ/new; (3) a waccine composition (III) comprising (II) and a pharmaceutical excipient; (4) an isolated nucleic acid encoding a peptide comprising (I) comprising (II) are useful for inducing callular immune responses for the prevention and treatment of cancer. (I) and (III) are useful for inducing callular immune responses for the prevention and treatment of cancer. (I) and (III) are useful for antigen when incubated with a T lymphocyte and in a persent of antigen when incubated with a T lymphocyte to (I) or (II). Epitope antigen when incubated with a T lymphocyte to (I) or (II). Epitope cancer in whole mighes mean that immunosuppressive epitopes that may be present in whole antigens may be avoided. Selected epitopes and y be combined to channed immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigen is eliminated. The vaccine provides the opportunity to combine epitopes derived from contines provides the opportunity to combine epitopes derived from multiple tumour-associated molecules addressing the problem of tumour-ctumour variability and reducing the likelihood of tumour escape due to antigen loss. AAG88266 to AAG89121 represent amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

least one human leukocyte antigen (HLA) binding peptide comprising an isolated, prepared epitope comprising one of 547 8-11 residue amino acid sequences (S1), given in AAB7630 to AAB76349. (1) has cytostatic, virucide, hepatotopic, antiinflammatory, anti-HIV (human immunodeficiency virus) and protozoacide activities, which can be used in vaccine production and is an inducer of cytotoxic T-cell response. (I) is useful for inducing a cytotoxic T cell response against a preselected antigen in a patient expressing a specific major histocompatibility complex (MHC) class I allele, by contacting cytotoxic T cells (CTLs) from the patient with (I). (I) is useful as a vaccine to treat and/or prevent viral infection and cancer such as prostate cancer, hepatitis B, hepatitis C, human papilloma virus (HPV) infection, cytomegalovirus (CMV), acquired immunodeficiency syndrome (AIDS), renal carcinoma, cervical carcinoma, malaria, and condyloma acuminatum
                                                                                                                                                                                                                                        Composition comprising human leukocyte antigen binding peptide which comprises isolated, prepared epitope useful for treating viral infections such as acquired immunodeficiency syndrome, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human leukocyte antigen; HLA; major histocompatibility complex; MHC; cytotoxic T lymphocyte; CTL; human class I MHC; immunogenic; HLA binding peptide; immune response; glycoprotein; cytostatic; virucide; hepatotropic; antiinflammatory; anti-HHV; vaccine; human immunodeficiency virus; protozoacide; viral infection; cancer; human immunodeficiency virus; protozoacide; viral infection; cancer; cytomegalovirus; CMV; acquired immunodeficiency syndrome; AIDS; renal carcinoma; cervical carcinoma; malaria;
                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a composition (I) which comprises at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens GAZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the beat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANT1980-AAU72481 represent melanoma antigen peptides of the invention. (Updated on 11-SEP-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human leukocyte antigen, HLA, major histocompatibility complex; MHC; cytocoxic T lymphocyte; CTL; human class I MHC; immunogenic; HLA binding peptide; immune response; glycoprotein; cytostatic; virucide; hepatocropic; antiinflammatory; anti:HIV; vaccine; human immunodeficiency virus; protozoacide; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; human papilioma virus; HPV; cytomegalovirus; CMV; acquired immunodeficiency syndrome; AIDS; renal carcinoma; cervical carcinoma; lymphoma; malaria;

                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                        The present invention describes a composition (I) which comprises at least one human leukocyte antigen (HLA) binding peptide comprising an solated, prepared epitope comprising one of $47 8-11 residue amino acid sequences (SI), given in AAB75803 to AAB7649. (I) has cytostatic, virucide, hepatotropic, antiinflammatory, anti-HIV (human immunodeficiency virus) and protozoacide activities, which can be used in vaccine production and is an inducer of cytotoxic T-cell response. (I) is useful for inducing a cytotoxic T cell response against a preselected antiper in a patient expressing a specific major histocompatibility complex (MHC) class I allele, by contacting cytotoxic T cells (CTLS) from the patient with (I) (I) is useful as a vaccine to treat and/or prevent viral infection and cancer such as prostate cancer, hepatitis B, viral infection and cancer such as prostate cancer, hepatitis B, hepatitis C, human papilloma virus (HPV) infection, cytomegalovirus (CMV), acquired immunodeficiency syndrome (AIDS), renal carcinoma, cervical carcinoma, malaria, and condyloma acuminatum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                    Composition comprising human leukocyte antigen binding peptide which comprises isolated, prepared epitope useful for treating viral infections such as acquired immunodeficiency syndrome, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   L-amino acid oxidase; fungus; hydrogen peroxide; detergent; peroxidase; determenter inhibiticon; bleach; laundry; toothpaste; preservative; cosmetic; bread; dough improver; water treatment; pulp production; lignin; catalytic deamination; EC 1.4.3.2.

The sequence represents the amino acid sequence of Trichoderma harzianum L-amino acid oxidase (BC 1.4.3.2), peptide #1. L-amino acid oxidase (acalyese the deamination of an L-amino acid in the presence of water and oxygen to produce a 2-oxo acid, ammonia and hydrogen peroxide. The isolated nucleic acid sequence is useful for producing or generating polypeptides with L-amino acid oxidase activity, which are useful in processes where in situ generation of hydrogen peroxide is desired, e.g. as component of detergent compositions having peroxidase systems. The polypeptides are particularly useful for dye transfer inhibition during laundaring or for improved bleaching in laundry detergents. The polypeptides encoded by the nucleic acid may also be incorporated into toothpaste or used for preservation of cosmetics. The polypeptides may be improved my cosmetics. The polypeptides may be improved my cosmetics. The polypeptides may be implemented in processes for treating wastewater from pulp production, and lignin modification. (Updated on 11-SEP-2003 to

De used for immuniaing subjects against HV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines of particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, and proup-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of tumour-associated antigens, which therefore reduces the likelihood of the antigens of an group-based vaccines. An additional advantage of an group-based vaccines approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response superseant peptide sequences used in the examplification of the present represent peptide sequences used in the examplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347) to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen.

Allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to combine selected groups (cTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP15501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.

compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunosuppressive groups that may be present in whole antigens can be avoide with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to compine selected groups (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. Application of the present represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

New polypeptides which selectively bind to expanded polyglutamine repeat domains, useful for treating neurodegenerative diseases, e.g. Huntington's disease.

Disclosure, Page 14; 59pp, English.

dentatorubral The present sequence is a polyglutamine repeat domain binding peptide. The peptide is useful for treating a cell that contains and expresses a protein having an expanded polyglutamine region (e.g. huntingtin; a trophin 1, ataxin 1, 2, 6 or 7; or androgen receptor protein), or treating a neurodegenerative disease characterised by the presence of expanded polyglutamine repeats, e.g. Huntington's disease, dentatorubral pallidoluysian atrophy (DREA), spinobulbar muscular atrophy, and spinocerebellar ataxia types 1, 2, 3, 6 and 7 :* .* .

```
The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYP1B1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYP1B1 that; binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYP1B1 or peptide of CYP1B1. Also described are: (1) a method for assessing the complex (MHC) molecule, involving measuring the level of CYP1B1 to the peptide of CYP1B1 in a sample from the patient complex molecule, involving measuring the level of CTL specific for CYP1B1 or the peptide of CYP1B1 in a sample from the patient complex presents a peptide of CYP1B1 in a sample from the patient complex molecule. That binds to MHC complex molecule, (3) an exvivo complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for the prevention, treatment and diagnosis of cancer. e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and complex molecules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the use of an immunogenic complex, comprising a non-pathogenic multi-component viral particle covalently linked to a javelin molecule (preferably a peptide) that selectively binds to a heat shock protein. The immunogenic complex is useful for anti-viral immune response, in a human or non-human subject. The anti-viral immunes in a particularly useful as a vaccine for preventing or ameliorating viral infections, e.g. hepatitis, influenza, mumps, HIV (human immunodeficiency virus) infection, pollo, tick-borne encephalitis or ebola virus infection. Avulos infection, pollo, tick-borne encephalitis peptides which may be used as javelins

number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (HHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is a javelin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a polypeptide monobody, which binds selectively to human alphavbeta3 integrin (CD51/CD61), comprising at least two human fibronectin (Fn)3 beta-strand domain sequences with a loop region sequence linked between adjacent beta-strand domain sequences and, optionally, an N-terminal tail of at least 2 amino acids, a C-terminal tail of at least 2 amino acids or both. The monobody is derived from the tenth fibronectin type III domain (FNfn10) which binds alphavbeta3 integrin and can modulate its activity. Alphavbeta3 integrin is a cell surface adhesion receptor involved in normal cell growth and survival and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; monobody; alphavbeta3; integrin; CD51; CD61; Fn3; fibronectin 3; beta-strand; tenth fibronectin type III domain; FNfn10; cell surface adhesion receptor; growth; survival; oncogenesis; RGD; for loop; antagonist; tumnor; osteoporosis; Paget's disease; humoral hypercalcaemia of malignancy; angiogenesis; retinopathy; arthritis; periodontal disease; psoriasis; smooth muscle cell migration; viral infection; fungal infection; bacterial infection; cancer.

in large scale in bacteria. The polypeptide monobody is useful for in large scale in bacteria. The polypeptide monobody is useful for inhibiting fantagonist) the activity of alphavbeta3 integrin. The polypeptide monobody or its conjugate comprising the polypeptide monobody or its conjugate comprising the polypeptide monobody conjugated to a chemotherapeutic agent, a contrasting agent or an organic chelating agent, is useful for treating, preventing or tumour metastasis, solid tumour growth, osteoporosis, pager's disease, humorah hypercalcaemia of malignancy, angiogenesis, retinopathy, arthritis, periodontal disease, psoriasis, smooth muscle cell migration, viral infection, fungal infection, bacterial infection and cancerous or precancerous conditions. Administration is carried out by contacting one cells expressing alphavbeta3 integrin with the polypeptide monobody to inhibit the activity of alphavbeta3 integrin on the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an epitope of human apolipoprotein C-III (ApoCIII). The specification describes ApoCIII epitopes, derived from within the region between amino acids 12-35, 12-21, 45-76 or 45-65. ApoCIII epitopes are potent in the prevention or reduction of atherosclerotic plaque formation over prolonged period of time, thus reducing the potential of atherosclerosis. ApoCIII epitopes are useful in the manufacture of a medicament for preventing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; apolipoprotein C-III; ApoCIII; epitope; atherosclerotic plaque;

The present invention describes a modified Cry protein (1) that is sensitive to pepsin and comprises at least one additional pepsin cleavage site (PCS). Also described: (a) increasing pepsin sensitivity of Cry proteins by incorporating at least one axtra PCS; (b) polynucleotides (II) that encode (I); (c) chimeric genes (CG) that contain a promoter. (II) that encode (I); (d) expression or transformed with (III), also, where contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by growing (IV); and (g) mono- or polyclonal antibodies (Ab) directed (G growing (IV); and (g) mono- or polyclonal antibodies (Ab) directed (II) by companies (I). (I) has insecticide activity. (I) can be used as consecticides, particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals, so do not persist for use, in foods, of seeds containing CY proteins). Extra PCS do not contenes increase degradation in the digestive tract of insects, so have no effect on insecticidal activity. ABV93150 to ABV93999 and ABP67997 to ABP68308 cry

The present invention describes a modified Cry protein (I) that is sensitive to pepsin and comprises at least one additional pepsin cleavage site (PCS). Also described: (a) increasing pepsin sensitivity of Cry proteins by incorporating at least one extra PCS; (b) polynucleotides (II) that encode (I); (c) chimeric genes (CG) that contain a promoter, (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by growing (IV); and (g) mono or polyclonal antibodies (Ab) directed against (IV); and (g) mono or polyclonal antibodies (Ab) directed against (IV); and issecticide activity. (I) can be used as sensitive to enzymes in the digestive tract of mammals, so do not persist in the tract (lack of persistence is required by regulatory authorities for use, in foods, of seeds containing CY proteins). Extra PCS do not increase degradation in the digestive tract of insects, so have no effect on insecticidal activity. ABV93450 to ABV93909 and ABP67997 to ABP68308 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New modified Cry protein, useful as insecticide, comprises at least one additional pepsin cleavage site to reduce persistence in mammalian gut.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a modified Cry protein (1) that is sensitive to pepsin and comprises at least one additional pepsin cleavage site (PCS). Also described: (a) increasing pepsin sensitivity of Cry proteins by incorporating at least one extra PCS; (b) polymucleotides (II) that encode (I); (c) chimeric genes (CG) that contain a promoter, (II) that encode (I); (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by growing (IV); and (9) mono- or polyglonal antibodies (Ab) directed against (I). (I) has insecticide activity. (I) can be used as insecticides, particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals, so do not persist in the tract (lack of persistence is required by regulatory authorities (for use, in foods, of seeds containing Cry proteins). Extra PCS do not increase degradation in the digestive tract of insects so have no effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          on insecticidal activity. ABV93450 to ABV93909 and ABP67997 to ABP68308 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified Cry protein, useful as insecticide, comprises at least one additional pepsin cleavage site to reduce persistence in mammalian gut.
                                                                                                                                                                                                                                         Bacillus thuringiensis; insecticide; toxin; Cry; pepsin cleavage site;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                 The present invention describes a modified Cry protein (1) that is aensitive to pepsin and comprises at least one additional pepsin cleavage stie (FCS). Also described: (a) increasing pepsin sensitivity of Cry proteins by incorporating at least one extra PCS; (b) polynucleotides (II) that encode (I); (c) chimeric genes (CG) that contain a promoter, (II) that encode (I); (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by growing (IV); and (g) mono- or polyclonal antibodies (Ab) directed against (I). (I) has insecticide activity. (I) can be used as insecticides, particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals so do not persist in the tract (lack of persistence is required by regulatory authorities for use, in foods, of seeds containing Cry proteins). Extra PCS do not increase degradation in the digestive tract of insectes, so have no effect on insecticidal activity. ABV93450 to ABV93399 and ABB67997 to ABV93450 on insection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó
                                                                                                                                                                                New modified Cry protein, useful as insecticide, comprises at least one additional pepsin cleavage site to reduce persistence in mammalian gut.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacillus thuringiensis; insecticide; toxin; Cry; pepsin cleavage site;

The present invention describes a modified Cry protein (I) that is ensitive to pepsin and comprises at least one additional pepsin cleavage sensitive to pepsin and comprises at least one additional pepsin cleavage site (PCS). Also described: (a) increasing pepsin sensitivity of Cry proteins by incorporating at least one extra PCS; (b) polynucleotides (II) that encode (I); (c) chimeric genes (CG) that contain a promoter, (II) that encode (I); (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where CC contains (IV) and (g) mono- or polyclonal antibodies (Ab) directed against (I). (I) has insecticide activity. (I) can be used as insecticides particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals, so do not persist in the tract (lack of persistence is required by regulatory authorities (in the tract (lack of persistence is required by regulatory authorities (or use, in foods, of seeds containing Cry proteins). Extra PCS do not increase degradation in the digestive tract of insectic, so have no effect on insecticidal activity. ABV33450 to ABV83309 and ABP67997 to ABV8308 con represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                  comprises at least one
                                                                                                                                                                                                                                                                                                           additional pepsin cleavage site to reduce persistence in mammalian gut.
                                                                                                                                                                                                                                     New modified Cry protein, useful as insecticide,
                                                                                                                                                                                                                                                                                                                                                                                                                              Example 4; Page 36; 134pp; French.
